FOR VILLAS, HOTELS AND GUEST HOUSES

Room-service orders, straight from the room.

Guests scan the QR code in their room, order from your menu, and watch their food being prepared and brought to them. No phone calls or messages to chase, no wrong room numbers, and nothing to download.

ROOM

07

EXAMPLE

Scan to order food

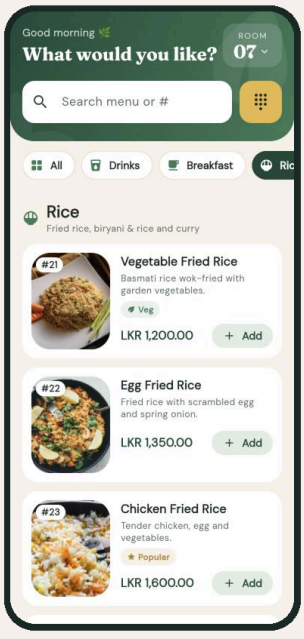

Example card. Each room gets its own working code.

SEE IT RUNNING

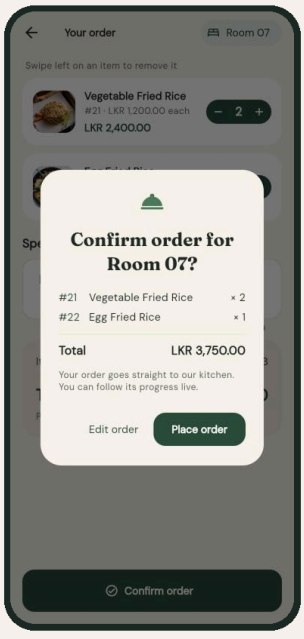

From scan to served, in four screens.

These are screens from the working demo app: a guest in Room 07 adds two dishes, confirms the order, and follows it from the kitchen to their door.

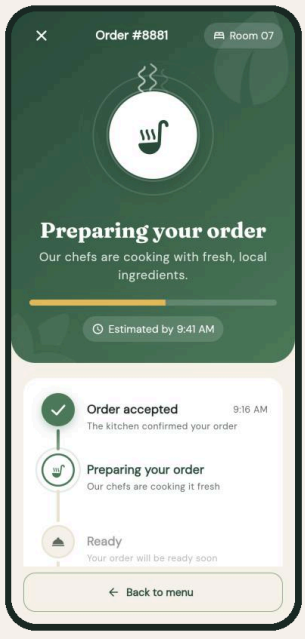

1 **Scan the QR, browse the menu**

THE PROBLEM TODAY

Ordering by phone or message works, until it gets busy.

Guests call or message with their room number and order. Staff write it down, pass it to the kitchen and confirm it by hand.

TODAY

```
"Room 7 here, 2 lime juice + 1 fried rice pls"
```

- Room numbers and dishes get misheard or written down wrong.
- Orders get lost between calls, messages and other requests.
- Guests don't know if anyone has seen the order, so they call or message again.
- Staff spend time on the phone instead of cooking and serving.

WITH THE APP

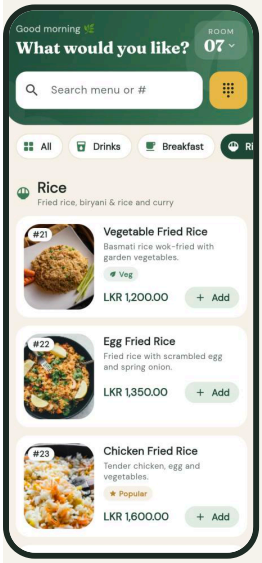

```
Order #5727 · Room 07 · #23 ×1, #1 ×2 · "less spicy"
```

- The room is set by the QR code, so it is always correct.
- Every order arrives complete: items, quantities, notes and total.
- Guests see each step live, so there are no "is my food coming?" messages.
- Dishes keep your menu numbers, so the kitchen recognises every order.

HOW IT WORKS FOR GUESTS

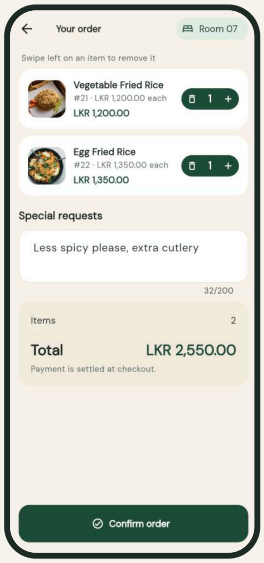

Three steps, about thirty seconds.

These are screenshots from the working demo app.

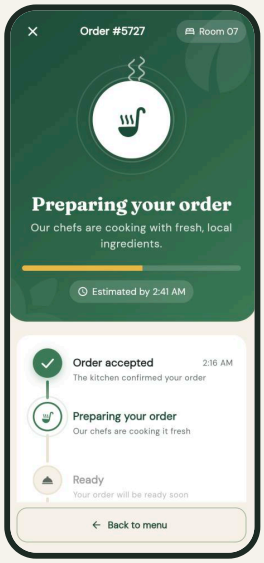

1 Scan and browse

The QR code opens the menu for that room, with a photo of every dish, categories, search, and the same item numbers as your printed menu.

2 Confirm the order

Guests review items, add a note like "less spicy", and tap Confirm order. It goes straight to the kitchen.

3 Follow it live

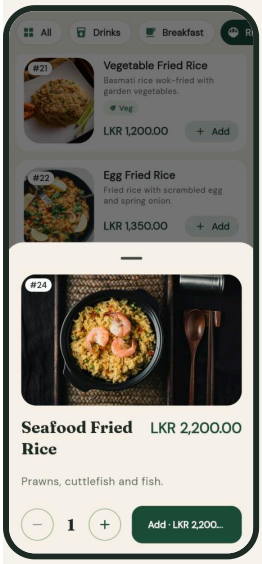

A tracking screen shows each step with a tick and the time, ending with a small celebration when the food arrives.

✓ Accepted ✓ Preparing ✓ Ready Served to your room

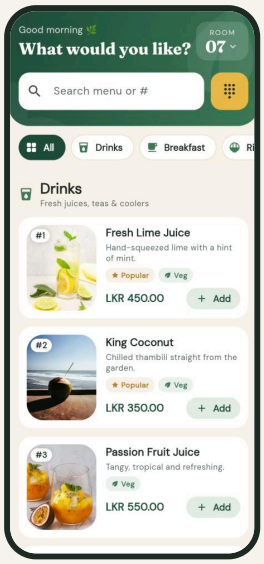

A CLOSER LOOK

Food that sells itself.

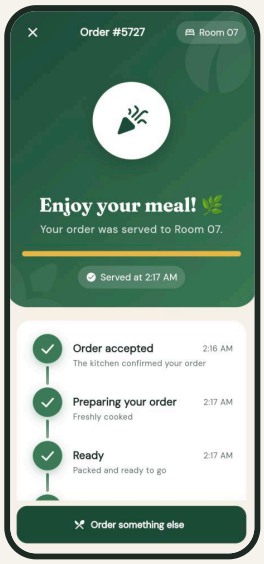

Tapping a dish opens a large photo with its description, so guests can see exactly what they are ordering, which makes it easier to try something new, like a kottu or a watalappan.

Dish details with photo

Drinks, with item numbers

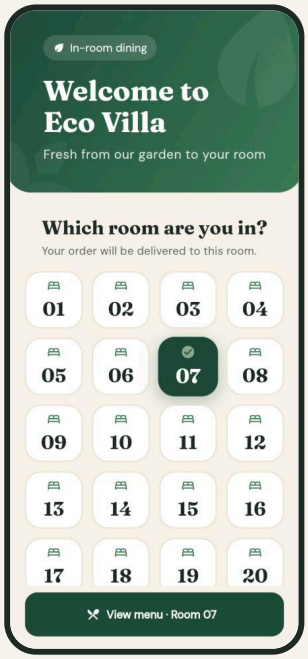

Served, with every step timed

NO QR CODE HANDY?

Guests can pick their room instead.

If a guest opens the app another way, for example from a link you share at check-in, they choose their room from a simple grid before seeing the menu. The phone remembers it for the rest of their stay, and they can change it any time.

- Works for every room you have
- The room is confirmed before every order
- Scanning a room's QR code skips this step

WHAT YOUR PROPERTY GETS

Built around how you already work.

No app download

It opens in the phone's browser from the QR code, on Android and iPhone. It can also be released as an app later.

Your menu, your photos

Set up with your real menu and photos of your own dishes. Change prices or mark a dish sold out at any time.

Looks like your property

A calm, clean design. Colours, name and logo are set to match your brand.

A kitchen screen comes next

The next phase is a simple staff screen where the kitchen accepts orders and marks them ready and served. That is what guests see update live.

NEXT STEP

Interested in automating your room-service orders? Let's meet.

In a short meeting I'll show you the app running live on a phone and walk through how it would work at your property, using your own menu.

1

Meet and see it live

A short meeting, in person or on a call. Try ordering yourself.

2

Load your menu

Your dishes, prices, item numbers and photos.

3

QR cards in every room

Printed cards, each opening the menu for that room.

4

Go live

The kitchen screen receives orders. Guests order from the room.
